CENSUS OF MERCHANDISING AND SERVICE ESTABLISHMENTS.

WEEKLY EARNINGS OF EMPLOYEES

IN

MERCHANDISING AND SERVICE ESTABLISHMENTS

IN

CANADA, 1935

I N T R O D U C T I O N

This report is based upon information secured in connection with the annual Census of Merchandising and Service Establishments, and presents statistics of weekly earnings of employees engaged in wholesale and retail trade and in motion picture theatres in Canada in 1935. The tables here presented give wage data for employees in specific lines of business, in addition to summary figures for all branches of retail trade and of wholesale trade. Provincial figures, in addition to Dominion averages, are shown.

The published reports of the Census of Merchandising and Service Establishments, 1931, show the total amounts paid in salaries and wages in various lines of business in retail and wholesale trade during 1930, together with the average number of employees for the same year. But, while the numbers of male and female employees are separately shown, total payroll only was reported, so that these figures are not suitable for determining average earnings of either sex.

This bulletin presents more detailed information regarding the weekly earnings of employees in wholesale and retail trade than was formerly available. Average weekly earnings have been computed and are shown separately for male and for female employees. But, while an average figure may be fairly representative of the earnings in a trade as a whole, it gives no indication of the number or relative proportions of the total number of employees who receive various amounts. Tables are, therefore, included classifying all employees on the basis of weekly earnings to show the number of employees who received specified amounts during the week for which the reports were made out.

Form of Inquiry.—The various firms reporting to the Census of Merchandising and Service Establishments were asked to fill in a schedule classifying their employees on the basis of weekly wage payments. Form of schedule used is as follows:

CENSUS OF MERCHANDISING AND SERVICE ESTABLISHMENTS, 1935

"Number of Employees Classified by Weekly Earnings, 1935"

Enter below the number of employees in your business according to their earnings in the week reported. Include all employees whether paid on an hourly, daily, weekly, monthly or commission basis. (Do not include proprietors, owners, firm members or partners.)

Earnings in Week Reported	Full-Time		Part-Time	
	Males No.	Females No.	Males No.	Females No.
Under \$6.00
\$ 6.00 to \$ 6.99
\$ 7.00 to \$ 7.99
\$ 8.00 to \$ 8.99
.....				
.....				
.....				
\$29.00 to \$29.99
\$30.00 to \$34.99
\$35.00 to \$39.99
\$40.00 to \$44.99
\$45.00 to \$49.99
\$50.00 and over
Total

Certificate: This is to certify that the information contained in this schedule is correct and complete to the best of my knowledge and belief and covers the week from, 1935, to, 1935.

Date of return:

....., 1935.

.....
(name)

.....
(title)

The wage earnings shown on the schedule increased by one dollar intervals from \$6.00 a week to \$29.99. From \$30.00 to \$50.00, five-dollar intervals were used, while all employees receiving more than \$50.00 a week were to be grouped.

It will be noted that the questionnaire states that proprietors, firm members or partners were not to be included but that all employees on salary, wage or commission basis were to be included. A distinction was to be made as between full-time and part-time and a further distinction as between male and female employees. Part-time employees are defined as those who regularly work part of the normal working day or part of the normal working week. Employees engaged only during the busy seasons of the year, but on a full-time basis when thus employed, were to be classified as full-time employees. All firms may not have made a proper distinction between seasonal and part-time employment as defined on the census schedules, so that in a few cases employees may be included in the part-time section who should properly be classified under the full-time category. Instructions attached to the schedules stated that details were to be given for the most recent week in 1935 for which salary and wage figures were available. The great majority of the schedules for the Census of Merchandising are returned during March and April, so that in most cases the classification of employees covers some week within these two months. It was also stipulated that all employees were to be reported, including sales clerks, delivery men or messengers and office staff.

The actual earnings of each employee in the week reported was to be the basis of classification rather than the rate of pay. That is, each employee was to be assigned to a classification on the schedule on the basis of the actual amount which he received (after making any deductions for loss of pay through illness or other causes) and not according to his scale of weekly wages. This point is of some significance in the interpretation of the number of employees reported in the lower wage brackets. It is, therefore, apparent that the figures given in this report both as to average earnings and distribution of employees on the basis of weekly earnings are based on the actual earnings in the week reported and must not be confused with wage rates or possible earnings. It is doubtful, however, whether all firms in making their returns observed this distinction and some reports may have been filled in on the basis of wage rates rather than actual earnings.

Scope and Form of Report.---For the annual Census of Merchandising Establishments, reports are secured from all chain store companies and from a large number of independent retail stores and wholesale establishments. Many of the larger chain store companies maintain a head office and one or more central warehouses in connection with their business. In some cases the head office is maintained as a separate department and in others as a part of the warehouse organization. In the absence of any way of allocating head office employees as between the retail stores and the warehouses, it was decided to limit the inquiry on weekly wage payments to store employees only, in so far as chain store companies were concerned. All store employees were to be reported, managers, delivery men, clerks, etc.

Since a complete coverage of employees is available for chains as compared with a sample for independent stores, it was deemed advisable to divide the part of this report dealing with wage earnings in retail trade into two sections. Section 1 gives wage statistics for employees engaged in independent retail stores including all department stores, while Section 2 gives similar information for retail chains. A third section (Section 3) is devoted to the weekly earnings of employees in wholesale trade and Section 4 presents similar data for employees in motion picture theatres.

The tables in each section are divided into two main divisions. The first set of tables shows average weekly earnings for full-time male and female employees in selected kinds of business. Provincial as well as Dominion averages are shown. No attempt was made to derive average earnings for part-time employees. The second set of tables shows the actual distribution of employees according to weekly wage earnings. Since not all independent stores or wholesale establishments are included in this survey, the tables take the form of percentage distributions and show the percentages of the total number of employees reported who received the various amounts. While a complete coverage is available for chains and the actual numbers in each wage class could be shown, percentages only are given in order to economize in space.

SECTION 1. INDEPENDENT RETAIL STORES

All figures given in this section relate to employees in independent stores only. All department stores are treated as independent establishments for the Census of Merchandising and Service Establishments so that employees in all such stores are included in this section. While a complete coverage of all independent retail establishments was secured for the complete Census of Merchandising and Service Establishments, 1931, the annual surveys of retail trade are based upon returns secured from a part of the total number only. The firms from which returns are secured include those stores which in 1930 had an annual business of \$20,000 or more and an additional number of firms (mostly smaller concerns) which have commenced operations since that date. Some firms have gone out of business since 1930 and these, of course, have been dropped from the mailing lists.

Representativeness of Sample.---Since data covering weekly wage earnings were secured only from those firms which report to the annual Census of Merchandising, the question at once arises: How representative of the whole field are the figures on weekly earnings given in the sample? Since the total number of employees in all independent stores in 1935 is not known, this question cannot be answered with absolute accuracy.

A rough estimate of the proportion which the sample forms of the whole field may be obtained in the following manner. The results of the complete census for 1930 show that there were then 136,926 full-time male employees in all independent stores in Canada. Full-time male employees in those independent stores included in the 1935 survey number 74,782 or 54.6 per cent of the number in all independent stores in 1930. This calculation, of course, underestimates the completeness of the coverage of employees in 1935 since the sample for that year has been compared with the total number in 1930, a year during which employment levels in retail trade were considerably higher.

The average number of male employees in each year from 1930 to 1934 is available for a constant sample of independent stores. An estimate based upon these figures would show that the total number of full-time male employees in all independent stores for 1934 was at least 15 per cent lower than in 1930. It is doubtful if figures for 1935 would show much change from 1934. Making allowance for a decrease of 15 per cent in employment levels between 1930 and 1935, one might estimate that the number of independent store full-time male employees whose weekly earnings were reported in 1935 formed at least 64 per cent of the average number of employees in all independent stores in that year.

In Table 1 a comparison is made of the number of full-time employees classified according to weekly earnings in 1935 and the average number of full-time employees in all independent stores in 1930. The ratios between the two figures are also given but, as already stated, these ratios underestimate the completeness of the coverage of employees in 1935 on account of the general decline in employment between the two dates.

In addition to giving figures for all independent stores as a whole, corresponding data are shown in Table 1 for stores classified according to kind of business, and it will be seen that the coverage for male employees (underestimated as indicated above) varies widely for different lines of trade. The small coverage for candy and confectionery stores (13.1 per cent) is due, of course, to the small number of large-size stores of this type and the consequent paucity of reports received from such firms. On the other hand, returns were secured from all department stores so that the decline between 1930 and 1935 in this case is due to changes in employment levels only. The number of full-time male employees in brewers' warehouses whose weekly earnings were reported in 1935 exceeded the total number in all such establishments in 1930.

In Table 2 a similar comparison by provinces is given and shows that the ratio of employees whose weekly earnings were reported in 1935 to the average number of full-time employees in all independent stores in 1930 was fairly uniform for all provinces.

Tables 1 and 2 show that for all independent retail stores as a whole and for most of the separate kind-of-business classifications for which figures are given, the numbers of employees whose weekly earnings were reported in 1935 are sufficiently large to provide a good sample, provided that the selection of reporting firms from the whole field was made in a representative manner. The reports on weekly earnings were secured from those firms which report sales figures for the annual Census of Merchandising Establishments. It has already been stated that reports for the annual Census of Merchandising are secured: (1) From firms which had annual sales of \$20,000 or more in 1930 and which continued in business in 1935, and (2) from a considerable number of smaller firms which have commenced business since 1930. Two questions at once present themselves: (1) Do average earnings of employees vary in a definite manner with size of store, and (2) if average earnings do vary with size of establishment, have the returns been secured in such a way as to secure the correct proportions of large and small stores in order to give a true average wage for all employees? In order to answer the first question, several tests were made in which the schedules on weekly earnings in 1935 were divided into groups on the basis of annual sales of the corresponding stores for 1934 and average weekly earnings for each group were found. Tables 3 and 4 present results of such tests for grocery and combination stores in Montreal.

Table 1.--Coverage of Independent Store Employees by Kinds of Business

Alberta	7,900	4,217	53.3	2,927	1,732	59.2
British Columbia	12,236	6,306	51.5	5,600	3,171	56.6

Table 3.--Average Weekly Earnings, Full-time Male Employees in Independent Grocery and Combination Stores in Montreal, 1935

(Stores Classified According to Amount of Annual Sales)

Amount of Annual Sales, 1934	Grocery Stores			Combination Stores		
	Number of stores reporting	Number of employees	Average weekly earnings \$	Number of stores reporting	Number of employees	Average weekly earnings \$
All Stores, Total	277	645	11.00	343	1,298	13.76
Stores having annual sales of --						
Less than \$20,000	126	207	8.79	89	171	10.92
\$20,000 - \$50,000	128	324	11.25	190	620	13.08
\$50,000 and over	23	114	14.29	64	507	15.55

Table 4.--Average Weekly Earnings, Full-time Female Employees in Independent Grocery and Combination Stores in Montreal, 1935

(Stores Classified According to Amount of Annual Sales)

Amount of Annual Sales, 1934	Grocery Stores			Combination Stores		
	Number of stores reporting	Number of employees	Average weekly earnings	Number of stores reporting	Number of employees	Average weekly earnings
			\$			\$
All Stores, Total	51	62	9.84	96	126	10.56
Stores having annual sales of --						
Less than \$20,000	17	19	8.03	10	10	9.00
\$20,000 - \$50,000	25	26	9.50	52	56	8.32
\$50,000 and over	9	17	12.38	34	60	12.92

A comparison of the figures shown in these two tables for the various size-of-business classes reveals a definite tendency for average weekly earnings to increase as the size of store increases. Additional examples of this tendency are to be seen in the following table which shows average weekly earnings of independent store employees in Ontario. Here the stores are grouped, not according to amount of annual sales but according to the total number of persons employed, a classification which is roughly indicative of the annual turnover. The omission of figures for male or female employees in certain lines of business mentioned in the table does not indicate the complete absence of such employees, but rather that the numbers were too small to permit of significant comparisons being made.

Table 5.--Average Weekly Earnings of Full-time Male and Female Employees in Independent Stores in Ontario, 1935

(Stores of Selected Kinds of Business, Classified According to Total Number of Employees)

	Male Employees		Female Employees

In Table 5 the stores are classified according to total number of employees in the week for which the wage schedules were filled in. (The basis in each case was the total number including male and female, part-time and full-time.) But, as already stated, the total number of employees can be taken as indicative of the size of business of the corresponding firms, and it is again evident that average earnings per employee are greatest in the larger stores. But it is not possible to compare average earnings for similar occupations in the various sizes of stores. The higher average for all employees taken together in the larger stores may be due in part to a greater proportion of employees in such stores performing duties ordinarily carried out by the owner himself in the smaller firms.

It is, therefore, necessary to consider the second question. Have reports been secured in such a way as to include a fair proportion of large and small stores? Obviously, if returns were secured

from all the large stores operating in 1935 and from only part of the smaller ones, an upward bias has been given to the average wage figures here shown. But it is not correct to assume that all persons whose weekly earnings were not reported in 1935 were employed in the smaller stores. A number of stores which had sales of less than \$20,000 in 1930 (and which would be omitted from the mailing lists for the annual surveys) have increased their annual business since that date. Again, a certain number of larger units which have commenced business since 1930 may not be reporting to the annual census. But even making allowance for these compensating factors, weekly earnings based on returns from the sample of firms reporting are recognized to be somewhat higher than the average for the whole field.

An attempt might be made to correct for the bias contained in these average weekly earnings. The data for full-time male employees in Ontario country general stores, as shown in Table 5, may serve as an example. Altogether, weekly earnings were reported in 1935 for 926 full-time male employees. Average weekly earnings for the 926 employees were \$15.04 and according to Table 5 varied from a minimum of \$11.74 for stores with one employee to a maximum of \$19.73 for the group of stores each having between 11 and 20 employees. In 1930 there were altogether 1,567 full-time male employees in all independent country general stores in Ontario. If one were to allow for a decrease of 20 per cent in number of full-time male employees between 1930 and 1935, it might be estimated that there were 1,254 employees in this kind of business in the latter year. Earnings of 926 of these were reported so that it remains to estimate a figure for the remaining 328 employees. Assuming that these 328 employees were chiefly in the smaller stores having one or two employees, Table 5 would suggest that perhaps \$12.50 might be taken as an average weekly earning for each person. If this amount be attributed to the estimated number whose earnings were not reported in 1935, average earnings for all full-time employees in country general stores in Ontario would work out at \$14.38 compared with the average of \$15.04 as shown in Table 5.

But, at best, any attempt to adjust the figures on weekly earnings must result in approximations. Estimates must be made both of the number of employees not included in the sample and also of the average earnings that these employees would receive. It has, therefore, been deemed advisable to leave the figures as they stand with the understanding that, since they are computed from returns covering a disproportionate number of the larger firms, they are slightly higher than they would be if all firms were included.

Representativeness of Period.—Another question which arises and which is relevant not only to independent stores but also to chain companies and wholesale firms, concerns the degree to which the week for which the report on weekly earnings was made out is representative of average conditions throughout the year. It has already been stated that the great majority of the wage schedules were completed for a week lying between the beginning of March and the end of April. A considerable number of firms, especially in the automobile trade, indicated that this period was seasonally below normal for the year both as to number of employees and average weekly earnings. Other firms stated that their report indicated a proportion of part-time employees to total employees which was in excess of average annual conditions.

Each of the firms reporting earnings of employees for a specified week in 1935 also reported the average number of persons employed during 1934. Two average annual figures were shown, one for male, including both full-time and part-time, and one for female, also including both full-time and part-time employees. In Table 6 a comparison is made between the number of male employees (full-time and part-time combined) as reported on the schedule on weekly earnings for the spring week in 1935 and the average number of male employees in the same stores during 1934. Figures are shown for seven selected kinds of business; and for all of these, except automobile establishments, the number reported on the wage forms was in excess of the average number during the year 1934. However, due to the inclusion of full-time and part-time employees in these data and to the inaccuracies attending the computation of average annual figures, too much significance cannot be placed upon the results. While the total number of employees reported for the week in 1935 may approach average totals during 1934, the numbers of full-time employees and part-time employees may not be representative of the average numbers in these two divisions in 1934. But a study of seasonal variations for retail trade as a whole shows that, while sales in March are somewhat lower than the average for the year, those in April are correspondingly higher. Since the returns on weekly earnings were spread over these two months, the figures presented herein are believed to be fairly representative of average annual conditions.

Table 6.--Independent Stores - Canada - Comparison for Selected Kinds of Business of Number of Male Employees in Specified Week in 1935 with Average Number in Same Stores During 1934

Kind of Business	Average Number of Male Employees 1934 (Full-time & Part-time)	Number of Employees in Specified Week in 1935			Number of Employees in Specified Week, % of Average, 1934

Automobile establishments	641	589	69	658	102.7	

Method of Calculating Average Weekly Earnings.---Average earnings per full-time employee for each kind of business were calculated from the corresponding frequency distributions of employees according to weekly wage payments. All employees within a given wage class were assigned an amount equal to the mid point of that class. For example, all employees reported as receiving between \$12.00 and \$12.99 per week were assumed to receive \$12.50. Arbitrarily chosen average weekly earnings of \$4.50 and \$70.00 per week were assigned to those employees reported as receiving less than \$6.00 per week and more than \$50.00 per week respectively.

Due to the recognized tendency for average weekly wages to be fixed at dollar figures rather than fractions thereof, the assumption of an average wage at the mid point of each wage interval rather than at its lower limit probably increases the calculated average earnings by an amount not exceeding 50¢ per week above its true value. In spite of this probable error, the usual statistical method of computing averages from classified data was adhered to.

Average weekly earnings for male and female employees in all independent retail stores as a whole, irrespective of kind of business, were calculated from the corresponding frequency distributions showing the distributions of all male and all female employees according to weekly earnings. A more exact procedure would involve the weighting of the average earnings for each kind of business according to the total number of employees in that trade. Several tests were made using as weights the number of employees in 1930, but these showed that no appreciable error was introduced by omitting this refinement. Two average earnings figures are shown in the tables. The first is an average based upon all stores reporting, while in the second all figures relating to restaurants, dairies and department stores have been omitted.

The remuneration of restaurant employees includes board in addition to a cash payment. Since some firms, in reporting weekly earnings of employees, made allowance for this factor while others did not, the average earnings as shown for restaurants cannot be considered as complete. In some cases the employees reported by dairies are thought to include the drivers of delivery routes. Figures for department stores are omitted from the second average in order to show the large weight which these figures have in determining the average for all retail trade.

Forms of Tables and Summary of Results.---Tables 10 to 13 are preliminary to the main sequence which follows, and show the distribution of full-time and part-time employees according to sex and also the distributions of male and female employees according to basis of employment (full-time and part-time). Approximately 15 per cent of all male employees in 1935 were on a part-time basis, as compared with 21.7 per cent of all female employees on a part-time basis. Of the total number of full-time employees, 68.8 per cent were male and 31.2 per cent were female. Corresponding figures for part-time employees show that 58.2 per cent were male and 41.8 per cent were female.

Average Weekly Earnings, Full-time Male Employees.---Table 14 shows average weekly earnings of full-time male employees by kinds of business, first, for the Dominion as a whole and, then, for each of the several provinces. In each section of the table the various kinds of business are arranged in ascending order of average weekly earnings in that geographical division. Average weekly earnings for all provinces and for all kinds of business as a whole were \$20.02 and ranged from \$13.10 for fruit and vegetable stores to \$25.75 for household appliance stores.

In using the averages shown for the various kinds of business, it is necessary to remember that all full-time male employees are included and no segregation is made on the basis of occupation, age or experience. For example, the average earnings for full-time male employees in drug stores are shown as \$16.96 per week. This figure is based upon returns covering graduate druggists, apprentices, store clerks and messenger boys if such were employed on a full-time basis. The average earnings of \$16.96 may not be representative of the actual amounts received by any one of these groups.

In addition to presenting arithmetic averages of weekly earnings, Table 14 also shows further data secured from the distribution tables which follow. Data are shown under three headings: (1) Lower quartile group, (2) Median group, (3) Upper quartile group. The median group for full-time male employees for the Dominion as a whole, and as given in Table 14, is seen to be the interval from \$18-\$19. This means

that if the earnings of all employees were arranged in an array in ascending order, the middle figure in that array would fall between the two amounts just stated. Another way of stating the same thing is that one-half the total number of employees received less than a figure lying between \$18 and \$19, while one-half receive more than that amount. The lower and upper quartile groups mark points half way between the median figure and the lowest and highest figures respectively.

For almost all kinds of business the arithmetic averages, as shown in the first columns of Table 14, are higher than the mid points of the median groups. This is indicative of the large weight which the higher-paid employees have in determining an average figure for the entire group.

Average Weekly Earnings, Full-time Female Employees.---Table 15 presents average weekly earnings of full-time female employees by kinds of business for the Dominion as a whole and for each of the several provinces. For the Dominion as a whole, average weekly earnings per full-time female employee in 1935 for all independent stores were \$13.52 and varied from a minimum of \$10.00 in the case of country general stores to a maximum of \$15.60 for firms classified as accessory, tire and battery establishments. Average weekly earnings by provinces for all kinds of business combined varied from a minimum of \$10.15 in the case of Prince Edward Island to a maximum of \$14.74 for British Columbia.

Distribution of Employees According to Weekly Earnings, 1935.---Table 16 presents the actual distribution of independent store full-time male employees according to weekly earnings in 1935. A Dominion summary is followed by provincial figures and the data for each geographical division are further broken down to show corresponding information for selected kinds of business. Since a complete coverage of independent store employees is not available, the table takes the form of percentage distributions and shows the percentages of the total number reported who received the various amounts rather than the actual number in each wage interval. Corresponding data for full-time female employees are given in Table 17, while Tables 18 and 19 show the distributions according to weekly earnings for part-time male and part-time female employees respectively.

Cumulative Percentage Distribution According to Weekly Earnings, 1935.---Tables 16 to 19 classify the total number of employees whose earnings were reported and show the percentages of this total number who received the various weekly earnings mentioned on the schedules. In Table 20 cumulative percentages derived from the former tables are presented to show the percentage of the total number of employees who received less than any given amount. According to this table, 33.1 per cent of the full-time male employees in independent stores received less than \$15 per week in 1935, while 65 per cent of the total number received less than \$21 per week. Therefore, 31.9 per cent, or rather fewer than one-third of all full-time male employees in independent stores, received between \$15 and \$21 per week. Table 20 will be found useful in summarizing the results shown in the preceding tables. Not only may the percentage who received less than a given amount be readily seen, but the percentage of the total who received earnings within set limits can be easily derived.

Cumulative figures are shown separately for male and female employees and a further distinction is kept as between those on a full-time and those on a part-time basis. Total figures for the Dominion and for each province only are shown. If corresponding data by kind of business are required, these may be obtained by successive additions from the percentage distributions shown in Tables 16 to 19.

SECTION 2. CHAIN STORES

Introduction

This section presents information on weekly earnings of employees engaged in retail chain stores during 1935. The various reports for the Census of Merchandising and Service Establishments classify as chains all companies (exclusive only of department store firms) which operate four or more retail units in the same or similar lines of trade. All department stores (irrespective of number owned by the same company) are classified as independent establishments, and earnings of employees in all such stores are included in Section 1 of this report. The chain store employees whose earnings are reported here include store managers, clerks, delivery men, cashiers and any other store employees. Head office staff and all employees engaged in warehousing

or transportation are not included.

Since returns on weekly earnings were received from practically all chain store companies⁽¹⁾, whereas returns were received from only part of the independent stores, this section of the report may be considered to be more complete than the one preceding. But even in the case of the reports on chain store employees, certain limitations should be mentioned.

In the case of chains, as in that of independent stores, the question arises whether the figures on weekly earnings as reported for one week in 1935 can be taken as being representative of average conditions throughout the year. The following tables present comparisons of the average number of employees in chain stores during 1934, as reported on the regular census schedules, and the numbers reported by the same firms on the special wage forms for the week in 1935. Table 8 presents figures for male employees and Table 9 for female employees, the data in each case covering selected kinds of business only.

- (1) In a few instances public utility companies which operate retail stores for the sale of gas and electrical appliances indicated that it was not possible to segregate employees engaged in the merchandising of appliances from those engaged in other activities. In other instances, manufacturer-controlled chains dealing primarily in office and store furniture and equipment indicated that their store managers, who were employed on a commission basis, were obliged to hire their employees on their own account. Reports on weekly earnings were not secured from such firms. Nor were data on weekly earnings secured from the provincial Government liquor stores.

Table 8.--Chain Stores - Canada - Comparison for Selected Kinds of Business of Number of Male Employees in Specified Week, 1935, with Average Number in Same Firms During 1934

Kind of Business	Average Number of Male Employees 1934 (Full-time & Part-time)	Number of Employees in Specified Week in 1935			Number of Employees in Specified Week, 1935, % of Average, 1934
		Full-time	Part-time	TOTAL	
Candy and confectionery stores	190	176	24	200	105.26
Grocery and meat stores.....	10,427	7,645	2,831	10,476	100.47
Variety stores	1,166	921	74	995	85.33
Motor vehicle dealers	846	635	185	820	96.93
Gasoline filling stations	2,337	2,057	80	2,137	91.44
Men's and boys' clothing and furnishings	515	437	75	512	99.42
Family clothing	339	319	56	375	110.62
Shoe stores	998	593	206	799	80.06
Hardware stores	313	314	7	321	102.56
Lumber and building materials	1,098	982	88	1,070	97.45
Drug stores	1,378	1,249	157	1,406	102.03
Tobacco stores and stands	565	532	7	537	95.04

Table 9.--Chain Stores -- Canada -- Comparison for Selected Kinds of Business of Number of Female Employees in Specified Week, 1935, with Average Number in Same Firms During 1934

Kind of Business	Average Number of Female Employees, 1934 (Full-time & Part-time)	Number of Employees in Specified Week in 1935			Number of Employees in Specified Week, 1935, % of Average, 1934
		Full-time	Part-time	TOTAL	
Candy and confectionery stores	601	576	125	701	116.64
Grocery and meat stores	1,844	1,182	600	1,782	96.64
Variety stores	6,317	2,785	3,501	6,286	99.51
Family clothing	439	335	109	444	101.14
Women's apparel	573	411	94	505	88.13
Shoe stores	114	76	33	109	95.61
Drug stores	309	256	73	329	106.47

A comparison of the figures given in Table 8 would indicate that the numbers of male employees reported for 1935 were somewhat below the annual averages for certain kinds of business (variety stores, filling stations, and shoe stores). The number of employees reported on the wage schedules agrees fairly closely for the other lines of business for which figures are shown. Corresponding data for female employees as given in Table 9 indicate that the total numbers reported in 1935 agree fairly closely with the averages in 1934. But, as previously stated in the section on independent stores, while the total number reported in 1935 may approach average conditions in 1934, the numbers of full-time employees and part-time employees may not be representative of the numbers in each of these classes in 1934.

Forms of Tables and Summary of Results

Since for most kinds of business a complete coverage of all chain store employees has been obtained, the actual number in each wage interval might be shown. In order to economize in space, however, the percentages only are shown so that the form of the tables for chain stores is similar to that for independent establishments.

Average weekly earnings of full-time male employees in chain stores classified according to kind of business are given in Table 25, first, for the Dominion as a whole and, then, for each province. The Dominion average for male employees in all chains was \$20.33 and varied from a minimum of \$14.97 in the case of candy and confectionery chains to a maximum of \$29.02 for household appliance chains. It should be noted, of course, that these figures on average earnings are based upon reports covering store managers, clerks, etc. Therefore, the combined averages, especially for male employees, should not be considered as representative for any of the individual occupations. Corresponding data for full-time female employees are given in Table 26. The Dominion average weekly earnings for female employees in chain stores were \$13.11 and varied from a minimum of \$10.02 in the case of country general stores to a maximum of \$17.51 in the case of stores selling office, school and store supplies.

Table 27 presents the distribution according to weekly earnings of full-time male employees in retail chains and shows the number of employees who received the various amounts. Corresponding data for full-time female employees are given in Table 28, for part-time male and part-time female employees in Tables 29 and 30, while cumulative frequencies are shown in Table 31.

SECTION 3. WHOLESALE TRADE

Reports on employees' weekly earnings in 1935 were secured from all the larger wholesale dealers and from a number of manufacturing firms which maintain sales offices or branches. Reports on weekly earnings sent in by such manufacturing firms relate only to employees engaged in distributive services and do not include factory workers. In all, returns were received covering the weekly earnings of 34,890 full-time employees, of whom 28,985 were male and 5,905 were female. Returns from most of the wholesale firms indicated that comparatively few persons were employed on a part-time basis, so that full-time employees only have been included in this report.

Dominion average weekly earnings per full-time male employees were \$26.86 for all kinds of wholesale business as a whole and varied from a minimum of \$18.45 for dealers in waste materials to a maximum of \$37.85 for dealers in metals and metal work. A comparison for all trades by provinces shows that the figures ranged from a minimum of \$17.23 in Prince Edward Island to a maximum of \$28.27 in Ontario. Average weekly earnings for full-time male employees for the Dominion as a whole and for each of the several provinces are given in Table 32.

Corresponding data for female employees are shown in Table 33. Average weekly earnings for female employees were \$16.24 for all lines of trade as a whole and ranged from a minimum of \$8.92 for dealers in waste materials to a maximum of \$21.09 for wholesale dealers in petroleum products. A comparison by provinces of average earnings of female employees reveals a considerably narrower spread than in the case of male workers, the figures ranging from \$12.87 for Prince Edward Island to \$17.74 for British Columbia.

Distribution of employees engaged in wholesale trade is shown in Tables 34 and 35, while the cumulative percentage distribution is given in Table 36.

SECTION 4. MOTION PICTURE THEATRES

Reports on weekly earnings of employees were secured from the operators of all motion picture houses in Canada. The reports were similar in form to those received from wholesale and retail merchandising establishments and were generally completed for some week in the spring months of 1935.

The 799 motion picture theatres operating in 1934 required an average of 4,251 male employees and 1,362 female employees during that year. The schedules on weekly earnings in 1935 covered 4,164 male employees and 1,402 female employees. Of the 4,164 male employees whose earnings were reported, 3,222 were on a full-time basis and 942 were on a part-time basis. The 1,402 female employees included 909 full-time and 493 part-time assistants.

Weekly earnings of full-time male employees averaged \$24.49 and varied from a maximum of \$30.18 in British Columbia to a minimum of \$16.56 in New Brunswick. In comparison with a Dominion average of \$11.46 for female employees, British Columbia again reported the highest figure or \$13.28, and Nova Scotia was lowest with \$8.42. Average weekly earnings of male employees in the several provinces are shown in Table 41 and corresponding data for female employees are given in Table 42. The actual distributions of employees on the basis of weekly wage payments are given in Tables 37 to 40.

Table 10.—Independent Stores - Distribution of Full-time Employees According to Sex,
by Provinces and by Kinds of Business, 1935

Province and Kind of Business	Total Employees Whose Earnings Were Reported		Male		Female	
	Number	%	Number	%	Number	%

WEEKLY EARNINGS OF EMPLOYEES
IN
RETAIL AND WHOLESALE TRADING ESTABLISHMENTS
IN
CANADA, 1936

Introduction

The second annual report on weekly earnings of employees in retail and wholesale trading establishments is presented herewith. This report is similar in form and scope to that published a year ago and shows average weekly earnings, and distribution according to weekly earnings, of employees in trading establishments in 1936. Provincial figures, in addition to Dominion averages, are shown, first for the total trade as a whole, and then for the kind-of-business groupings used in the annual Census of Merchandising. Most of the schedules for this census are received during the months of March and April so that the information given here may be taken as representative of average conditions during the spring of 1936.

Average weekly earnings shown in this report are not strictly comparable with those shown in the corresponding bulletin for 1935. Average figures in both cases were computed in the ordinary manner from the distribution tables showing the numbers of persons who received stated amounts. The wage intervals on the 1935 schedule went only as high as \$50.00 per week, so that in computing average earnings for that year it was necessary to assume an arbitrarily chosen figure for all those who were reported as receiving more than that amount. The schedule used in 1936 contained two additional intervals, \$50.00 to \$74.99 and \$75.00 to \$99.99, so that in this case it was only necessary to take an estimated average figure for the much smaller number who were reported as receiving \$100.00 or more per week. In compiling the report for 1935, an average weekly earning figure of \$70.00 was attributed to those employees reported as receiving \$50.00 or more each week. The more complete data secured for 1936 would suggest that this figure was too low so that figures shown in the report for 1935 underestimate, to a slight degree, the average weekly earnings of employees in that year.

A comparison of average weekly earnings in 1935 and 1936 for employees in wholesale and retail trading establishments is given on the next page. Two figures are shown in each category for 1936. In arriving at the second figure shown in each case, an average of \$150.00 was attributed to all employees in the group reported as receiving \$100.00 or more per week. The first figure shown for 1936, and that which is believed to be less accurate although more comparable with corresponding data for the preceding year, was obtained by making all estimates on the same basis as in 1935. That is, the first figure was obtained by attributing \$70.00 per week to all employees reported as receiving \$50.00 per week or more in 1936.

Two figures are shown for 1936, not only in order to permit a more valid comparison with data for the preceding year, but also to demonstrate the differences in average figures derived from frequency distributions when different methods are followed in dealing with the end groupings. Since few female employees in any branch of wholesale or retail trade receive \$50.00 or more per week, the difference in average earnings derived from the two methods in this case is but slight. The differences in the figures shown for male employees are

of more consequence and for some lines of wholesale trade (chemicals and paints, and petroleum products) in which a fairly large proportion of the total employees was reported as receiving \$50.00 per week or more, the differences arising from the change in method are such as to render impossible any comparison between the average earnings shown herein for 1936 and those shown for 1935 in the corresponding report issued a year ago.

Comparison of Average Weekly Earnings of Full-Time Employees,
1935 and 1936

	1935	1936	
		1935 basis	New basis
Wholesale Trade --			
Male	26.86	27.04	27.78
Female	16.24	16.86	16.82
Retail Trade (Independent)(1) --			
Male	20.02	20.26	20.45
Female	13.52	13.57	13.57
Retail Chains(2) --			
Male	20.33	20.98	21.14
Female	13.11	12.95	12.96

(1) Figures shown for independent stores are based on earnings of paid employees only. Proprietors are not included.

(2) Figures shown for chains are based on earnings of store managers, clerks and any other store employees. Head office or warehouse employees are not included.

Form of Inquiry.--Except for the addition of the two weekly-earning intervals mentioned in the preceding section, the schedule for 1936 was similar in form to that for 1935. The form of schedule used is as follows:

CENSUS OF MERCHANDISING AND SERVICE ESTABLISHMENTS, 1936

"Number of Employees Classified by Weekly Earnings, 1936"

Enter below the number of employees in your business according to their earnings in the week reported. Include all employees whether paid on an hourly, daily, weekly, monthly or commission basis. (Do not include proprietors, owners, firm members or partners.)

Earnings in Week Reported	Full-Time		Part-Time	
	Male No.	Female No.	Male No.	Female No.
Under \$6.00
\$ 6.00 to \$ 6.99
\$ 7.00 to \$ 7.99
.....				
\$45.00 to \$49.99
\$50.00 to \$74.99
\$75.00 to \$99.99
\$100.00 and over
Total

Certificate: This is to certify that the information contained in this schedule is correct and complete to the best of my knowledge and belief and covers the week from, 1936, to, 1936.

Date of return: (Name)
....., 1937. (Title)

The actual earnings of each employee in the week reported was to be the basis of classification rather than the rate of pay. That is, each employee was to be assigned to a classification on the schedule on the basis of the actual amount which he received (after making any deductions for loss of pay through illness or other causes) and not according to his scale of weekly wages. It is, therefore, apparent that the figures given in this report both as to average earnings and distribution of employees on the basis of weekly earnings are based on the actual earnings in the week reported and must not be confused with wage rates or possible earnings. In a few instances, however, firms failed to make this distinction when reporting and filled in their schedules on the basis of wage rates rather than actual earnings.

Scope and Form of Report.--For the annual Census of Merchandising Establishments, reports are secured from all chain store companies and from a large number of independent retail stores and wholesale establishments. Many of the larger chain store companies maintain a head office and one or more central warehouses in connection with their business. In some cases the head office is maintained as a separate department and in others as a part of the warehouse organization. In the absence of any way of allocating head office employees as between the retail stores and the warehouses, it was decided to limit the inquiry on weekly wage payments to store employees only, in so far as chain store companies were concerned. All store employees were to be reported, managers, delivery men, clerks, etc.

Since a complete coverage of employees is available for chains as compared with a sample for independent stores, it was deemed advisable to divide the part of this report dealing with weekly earnings in retail trade into two sections. Section 1 gives statistics for employees engaged in independent retail stores including all department stores, while Section 2 gives similar information for retail chains. A third section (Section 3) is devoted to the weekly earnings of employees in wholesale trade.

The tables in each section are divided into two main divisions. The first set of tables shows average weekly earnings for full-time male and female employees in selected kinds of business. Provincial as well as Dominion averages are shown. No attempt was made to derive average earnings for part-time employees. The second set of tables shows the actual distribution of employees according to weekly earnings. Since not all independent stores or wholesale establishments are included in this survey, the tables take the form of percentage distributions and show the percentages of the total number of employees reported who received the various amounts. While a complete coverage is available for chains and the actual numbers in each wage class could be shown, percentages only are given in order to economize in space.

SECTION 1 - INDEPENDENT RETAIL STORES

All figures given in this section relate to employees in independent stores only. The schedule stipulated that proprietors were to be omitted so that these data refer only to hired employees. All department stores are treated as independent establishments for the Census of Merchandising and Service Establishments so that employees in all such stores are included in this section. While returns from all independent stores were secured for the complete Census of Merchandising and Service Establishments, 1931, the annual surveys of retail trade are based upon returns secured from part of the total number only. The firms from which returns are secured include those stores which in 1930 had an annual business of \$20,000 or more and an additional number of firms (mostly smaller concerns) which have commenced operations since that date. It is estimated that the number of employees included in this sample forms approximately 65 per cent of the total employees in all independent retail stores.

Since data covering weekly earnings were secured from only those firms which report to the annual Census of Merchandising, the question of how representative this sample is of the entire field at once arises. A somewhat detailed discussion of this subject is given in the report on weekly earnings of employees for 1935 and the results only need be mentioned here. A study of average weekly earnings for employees in stores classified according to amount of annual sales showed that average earnings were higher in the larger than in the smaller stores. Since the sample of stores reporting to the annual Census of Merchandising contains a disproportionate number of large firms, it is evident then that average weekly earnings computed from returns secured for that census are somewhat higher than would be shown if a complete coverage of the entire field were available.

Another question that arises concerns the degree to which the week for which the reports on weekly earnings were made out may be representative of average conditions throughout the year. A discussion of this subject also appears in the corresponding report for 1935. While abnormal conditions in the spring months may affect the figures shown herein for a few lines of trade, it is believed that in most instances the weekly earnings given in this report are fairly typical of average annual conditions.

Method of Calculating Average Weekly Earnings

Average earnings per full-time employee were calculated for each kind of business from the corresponding frequency distributions. All employees within a given wage class were assigned an amount equal to the mid-point of that class. For example, all employees reported as receiving between \$12.00 and \$12.99 per week were assumed to receive \$12.50. Arbitrarily chosen average weekly earnings of \$4.50 and \$150.00 per week were assigned to those employees reported as receiving less than \$6.00 per week and more than \$100.00 per week respectively. Due to the recognized tendency for average weekly wages to be fixed at dollar figures rather than fractions thereof, the assumption of an average wage at the mid-point of each wage interval rather than at its lower limit probably increases the calculated average earnings by an amount not exceeding 50¢ per week above its true value. In spite of this probable error, the usual statistical method of computing averages from classified data was adhered to.

Two average earnings figures are shown in the tables. The first is an average based upon all stores reporting, while in the second all figures relating to restaurants, dairies and department stores have been omitted. The remuneration of restaurant employees includes board in addition to a cash payment. Since some firms, in reporting weekly earnings of employees, made allowance for this factor while others did not, the average earnings as shown for restaurants cannot be considered as complete. In some cases the employees reported by dairies are thought to include the drivers of delivery routes. Figures for department stores are omitted from the second average in order to show the large weight which these figures have in determining the average for all retail trade.

Forms of Tables

Tables 1 to 4 are preliminary to the main sequence which follows and show the distribution of full-time and part-time employees according to sex and also the distributions of male and female employees according to basis of employment (full-time and part-time).

Tables 5 and 6 show average weekly earnings by kinds of business for full-time male and full-time female employees respectively, first for the Dominion as a whole, and then for each of the several provinces. In each section of the tables, the various kinds of business are arranged in ascending order of average weekly earnings in that geographical division.

In using the averages shown for the various kinds of business, it is necessary to remember that all full-time male employees are included and no segregation is made on the basis of occupation, age or experience. For example, the average earnings for full-time male employees in drug stores are shown as \$17.76 per week. This figure is based upon returns covering graduate druggists, apprentices, store clerks and messenger boys if such were employed on a full-time basis. The average earnings of \$17.76 may not be representative of the actual amounts received by any one of these groups.

In addition to presenting arithmetic averages of weekly earnings, Tables 5 and 6 also show further data secured from the distribution tables which follow. Data are shown under three headings: (1) Lower quartile group, (2) Median group, (3) Upper quartile group. The median group for full-time male employees for the Dominion as a whole, and as given in Table 5, is seen to be the interval from \$18-\$19. This means that if the earnings of all employees were arranged in an array in ascending order, the middle figure in that array would fall between the two amounts just stated. Another way of stating the same thing is that one-half the total number of employees received less than a figure lying between \$18 and \$19, while one-half received more than that amount. The lower and upper quartile groups mark points half way between the median figure and the lowest and highest figures respectively. For almost all kinds of business the arithmetic averages, as shown in the first columns of Table 5, are higher than the mid-points of the median groups. This is indicative of the large weight which the higher-paid employees have in determining an average figure for the entire group.

Tables 7 to 10 show the actual distribution of employees according to weekly earnings for full-time male and full-time female employees and then for those in the part-time class. Since a complete coverage of independent store employees is not available, these tables take the form of percentage distributions and show the percentages of the total numbers reported who received the various amounts rather than the actual number of persons in each group. Cumulative percentage distributions are presented in Table 11 and show the percentages of the total number who received less than any given amount. This table is useful in summarizing the results shown in the preceding tables. In addition, the proportion of all employees that received weekly earnings within set limits can be readily derived.

SECTION 2 - CHAIN STORES

The tables on weekly earnings of employees in retail chains are similar in form to those for independent stores. The chain store classification is taken to include all groups of four or more stores owned or operated by the same firm and which carry on the same or similar lines of trade. Groups of department stores form the only exception to this rule. All department stores (irrespective of whether they are independently operated or not) are classified as independent establishments for the reports of the Census of Merchandising. Earnings of employees in all department stores are included in Section 1 of this report. The chain store employees included in this section comprise store managers, clerks, delivery men, cashiers and any other store employees. Head office staff and all employees engaged in warehousing or transportation are not included.

Since returns on weekly earnings were received from practically all chain store companies while only a sample of independent stores was covered, the figures for chains may be considered to be more complete than those for independents. In a few instances, public utility companies which operate retail stores for the sale of gas and electrical appliances indicated that it was not possible to segregate employees engaged in selling appliances from those in other activities. In other instances, firms indicated that they engaged commission salesmen who hired additional help on their own account. Since the head offices of the chain firms were usually unable to classify these locally-engaged employees according to their weekly earnings, all such commission salesmen were omitted. Nor were data on weekly earnings secured from the provincial liquor stores which are classified as chains.

Weekly earnings of full-time male employees in chain stores averaged \$21.14 for the Dominion as a whole in 1936 and ranged from \$16.35 for restaurants to \$31.57 for employees in stores dealing in office, store and school supplies. The figure for restaurants may not in all cases include allowances for meals provided for employees.

Comparisons of average earnings for 1936 as presented here and those for 1935 as shown in the report published a year ago must be viewed in the light of the statements made in the introduction to this report relating to differences in the methods of calculating these figures. In making any comparison between average earnings in chains and independents, it must also be remembered that the chain figures relate to all store employees, store managers, clerks, etc. These combined averages cannot be thought of as representative of any of the individual occupations.

Distributions of chain store employees according to sex and according to basis of employment are presented in Tables 12 to 15. Average earnings are shown in Tables 16 and 17. Distributions of employees according to weekly earnings are shown in Tables 18 to 21, while the cumulative percentage distribution is shown in Table 22.

SECTION 3 - WHOLESALE TRADE

In connection with the annual Census of Merchandising and Service Establishments, reports are secured from all the larger wholesale dealers in the country. These reports are used in determining the trend in wholesale trade in recent years. Schedules classifying employees in wholesale trading establishments according to their weekly earnings are also secured and tables compiled from these returns are included in this report. In all, returns were received covering the earnings of 38,157 employees, of whom 31,689 were male and 6,468 were female. Part-time employees form but a very small proportion of the total number engaged in wholesale trade, so that full-time employees only are included here.

Weekly earnings for full-time male employees in wholesale trade averaged \$27.78 in 1936. Since a comparatively large proportion of male employees in wholesale trade receive \$50.00 or more per week (8.1 per cent), any comparisons between average earnings for 1936 and 1935 are seriously affected by the different methods followed in computing the figures for the two years. More detailed explanations covering this point are given in the introduction to this report.

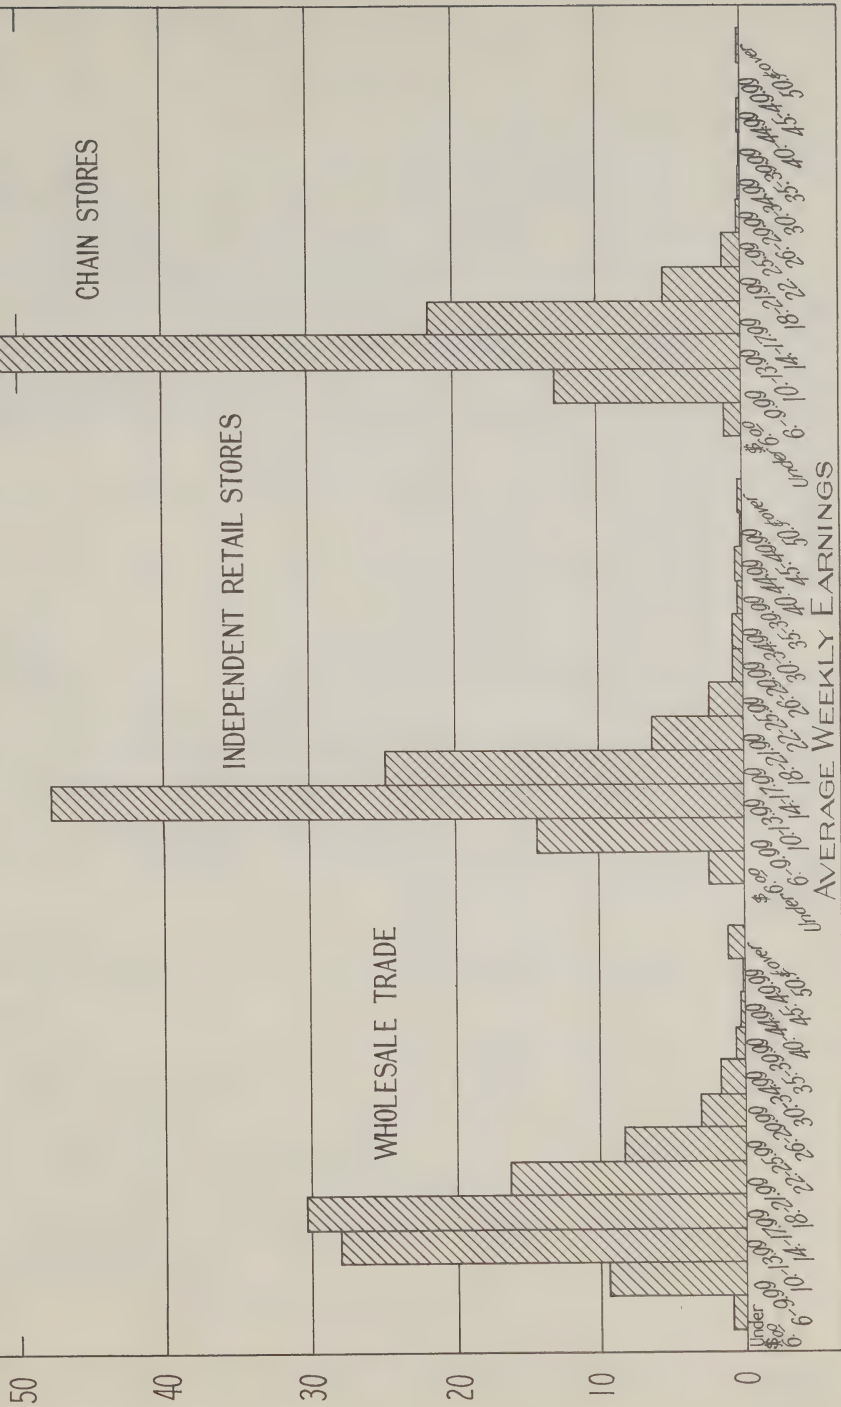

In comparison with the average figure of \$27.78 for male employees in all wholesale trade as a whole, average earnings varied from \$18.68 for the waste materials group to \$42.73 for dealers in chemicals and paints. Almost 24 per cent of all employees in the latter classification were reported as receiving \$50.00 or more per week.

Weekly earnings for female employees in wholesale trade averaged \$16.82 and varied from \$10.68 for dealers in waste materials to \$25.36 for the petroleum products group.

Tables 23 to 27 show average earnings and distribution of employees according to weekly earnings for wholesale trade. These tables are similar in form to those presented for retail stores, both chains and independents.

CENSUS OF MERCHANDISING AND SERVICE ESTABLISHMENTS

Weekly Earnings of Employees in Retail and Wholesale Trading
Establishments in Canada, 1937.

Introduction

This report, based on information secured in connection with the annual Census of Merchandising and Service Establishments, presents statistics of weekly earnings of employees engaged in retail and wholesale trading establishments in Canada in 1937. The report is similar in form and scope to bulletins previously issued for 1935 and 1936 and shows average weekly earnings and distribution of employees according to amount of weekly earnings, by provinces and by kind-of-business groups within each province. Separate figures are shown for male and female employees and a further distinction is made between those on a full-time and part-time basis. The results contained herein have been compiled from returns submitted by all chain store companies and from a large number of independent stores and wholesale firms. Each firm submitted a return classifying its employees according to actual earnings received during a given week. Most of the schedules for this survey were completed for a week in March or April so that the results shown in this report may be taken as typical of average conditions during the spring of 1937. The results shown herein are divided into three main sections: independent retail stores including all department stores, chain stores and wholesale trading establishments. Figures are shown under each section for average weekly earnings for full-time male and female employees. Then tables are presented to show the percentages of the total number of employees reported who received various amounts. In using the averages shown for the various kinds of business, it is important to remember that no segregation is made on the basis of occupation, age or experience. For example, the average earnings for full-time male employees in drug stores is based on returns covering graduate druggists, apprentices, store clerks and messenger boys if such were engaged on a full-time basis. The average for the group as a whole cannot be attributed to any one of these categories.

Summary of Results

Independent Stores

Weekly earnings of full-time male employees in those independent retail stores reporting to this survey averaged \$20.90 in 1937 compared with \$20.45 in 1936, increases being general for all provinces and for about two-thirds of the individual lines of business for which separate data are available. Average earnings per full-time male employee were highest in Manitoba at \$24.15, and were lowest in Prince Edward Island at \$16.65. Averages for other provinces were as follows: British Columbia, \$22.87; Ontario, \$22.06; Alberta, \$21.58; New Brunswick, \$19.54; Nova Scotia,

\$18.77; Saskatchewan, \$18.53; and Quebec, \$18.11.

Average figures ranged widely for different lines of business, being lowest at \$12.85 for candy and confectionery stores and highest, at \$26.05 for department stores. Average earnings for some of the more important lines of business occupying intermediate positions were as follows: \$13.80 for grocery stores, \$14.71 for combination stores, \$15.87 for country general stores, \$17.65 for drug stores, \$18.54 for hardware stores, \$23.45 for motor vehicle dealers, and \$23.92 for men's and boys' clothing stores.

The average figure for full-time female employees was \$13.74 in 1937 compared with \$13.57 in 1936 and ranged from \$15.04 in British Columbia to \$9.76 in Prince Edward Island. Results for individual kinds of business show a variation ranging from \$10.20 in country general stores to \$17.54 for a small group of female employees in household appliance stores. Full-time female employees in department stores averaged \$14.41 per week while the figure for women's apparel stores was \$15.18.

Independent Stores - Average Weekly Earnings, Full-time
Male and Female Employees, by Provinces, 1936 and 1937.

	Full-time Male		Full-time Female	
	1936	1937	1936	1937
	\$	\$	\$	\$
CANADA	20.45	20.90	13.57	13.74
Prince Edward Island ...	16.63	16.65	10.23	9.76
Nova Scotia	18.32	18.77	11.37	11.90
New Brunswick	19.05	19.54	11.05	11.52
Quebec	17.93	18.11	12.41	12.25
Ontario	21.51	22.06	14.34	14.43
Manitoba	22.54	24.15	13.01	13.65
Saskatchewan	18.48	18.53	13.11	13.62
Alberta	21.30	21.58	14.36	14.50
British Columbia	22.23	22.87	14.77	15.04

Not all independent stores furnished information on which these averages are based. Weekly earnings were reported by those stores submitting sales figures for the annual survey of retail trade and comprising those establishments having annual sales of \$20,000 or more in 1930, together with a number of smaller firms which have commenced operations since that date. Since the sample number reporting contains a disproportionate number of large firms, it is evident that average weekly earnings thus obtained are somewhat higher than would be the case were a complete coverage of the whole field available. Figures for independent stores relate to paid employees only; proprietors engaged in their own stores are not included.

The independent stores included in the sample employed a total of 138,507 persons of whom 116,609 or 84.2 per cent were on a full-time basis, while 21,898 or 15.8 per cent were part-time workers. Included in the totals are 91,741 male employees divided in the ratio 87.6 per cent full-time and 12.4 per cent part-time. Of the 46,766 female employees included in the total figure, 36,215 or 77.4 per cent were full-time, while 10,551 or 22.6 per cent were on a part-time basis.

Distribution of full-time male employees according to amount of weekly earnings shows that approximately 20 per cent of the total number received less than \$12.00 per week; 47 per cent received less than \$18.00 per week, while 25 per cent received \$25.00 per week or more. Corresponding results for full-time female employees show that 31 per cent received less than \$12.00 per week; 89 per cent of the

total number received less than \$18.00 and only 3 per cent received as much as \$25.00 per week. It is important to remember in this connection that the basis of classification of employees was actual earnings rather than wage rates or possible earnings. For example, an employee engaged at the rate of \$20.00 per week, but who worked only half the week for which the report was made and who was paid only for the time actually worked, would be assigned to the \$10.00 rather than to the \$20.00 a week category.

Approximately 50 per cent of all part-time employees in independent stores, male and female alike, received less than \$6.00 per week. Part-time employees are taken to include those who work less than one-half the normal working day or less than half the normal working week. Seasonal employees, engaged full time for the period of employment, are included in the full-time category.

Chain Stores

Chain stores are taken to mean all groups of four or more retail establishments under the one ownership or management and carrying on the same or similar lines of business. Department stores form one exception to this rule. All department stores are treated as independents irrespective of the number under the same ownership or control. The chain store employees included in this section comprise store managers, clerks, cashiers, delivery men and any other store employees. Head office staff and all employees engaged in warehousing or transportation from warehouse to stores are not included. Practically all chain store companies furnished information regarding weekly earnings of employees. Figures were secured for a total of 45,557 chain store employees, of whom 33,810 were full-time and 11,747 or 25.8 per cent were on part time. Included in the totals are 29,075 male employees divided in the ratio 82.3 per cent full-time and 17.7 per cent part-time. There were 16,482 female employees and of this number 9,894 or 60.0 per cent were on a full-time basis and 6,588 or 40.0 per cent were on a part-time basis.

Weekly earnings for full-time male employees in chain stores averaged \$21.20 in 1937, practically unchanged from the \$21.14 calculated for the preceding year. Average earnings ranged provincially from \$19.00 in Quebec to \$24.05 in Manitoba, results for individual provinces varying but little from corresponding amounts for the preceding year. Results for individual lines of business show variation ranging from \$15.33 for candy and confectionery stores to \$34.72 for a small group (mostly store managers) in women's apparel and accessories stores. Average weekly earnings for some of the more important chain store categories are as follows: \$16.93 for grocery and combination stores, \$19.36 for drug stores, \$19.95 for filling stations, \$25.15 for household appliance stores and \$27.92 for variety stores.

Weekly earnings for full-time female employees in chain organizations were also practically unchanged in 1937 from 1936, the average for the more recent year standing at \$13.12 compared with \$12.96 for the earlier period. Results for individual lines of business ranged from \$10.81 for country general stores to \$17.26 for employees in office, store and school supplies and equipment dealers. Weekly earnings averaged \$12.05 for full-time female employees in variety stores, \$13.08 for women's apparel stores and \$13.39 for food stores including grocery, combination stores and meat markets.

Distribution of employees according to amount of earnings indicates that approximately 23 per cent of the full-time male employees in chain stores received less than \$12.00 per week, 47 per cent received less than \$18.00 per week, while 29 per cent received \$25 per week or more. Corresponding data for full-time female employees show that 35 per cent of the total number received less than \$12.00 per week, 92 per cent received less than \$18.00 per week and only slightly over one per cent received as much as \$25.00 per week. Again it is important to remember that the basis of classification is the amount actually received making allowances for deductions due to lost time rather than weekly wage rates or maximum possible earnings.

Almost 66 per cent of the part-time male employees engaged in chain stores averaged less than \$6.00 per week and 85 per cent of the total number received less than \$12.00 per week. Earnings of less than \$6.00 per week were secured by 48 per cent of the part-time female employees, while 88 per cent of the total number received less than \$12.00 per week.

Chain Stores - Average Weekly Earnings, Full-Time Male and Female Employees, by Provinces, 1936 and 1937.

	Full-time Male		Full-time Female

Wholesale Trade

Weekly earnings of full-time male employees in wholesale trading establishments averaged \$27.17 in 1937 and ranged provincially from \$18.66 in Prince Edward Island to \$28.74 in Ontario. Results for individual lines of business indicate that average weekly earnings were lowest for employees in the waste materials group and were highest for wholesalers in chemicals and paints. Increases over 1936 were registered for 13 trades and decreases for 14, the average for the wholesale trade as a whole at \$27.17, standing somewhat lower than the \$27.78 calculated for the preceding year.

Average weekly earnings for full-time female employees at \$16.89 were practically unchanged from the amount recorded for the preceding year. Averages for individual lines of business ranged from \$10.30 for dealers in waste materials to \$25.27 for the petroleum products group. Increases over 1936 were registered for 15 groups and decreases for 8.

Distribution of employees according to amount of weekly earnings indicates that 10 per cent of all full-time male employees in wholesale trading establishments received less than \$12.00 per week; 31 per cent of the total number received less than \$18.00 per week, while about 43 per cent received \$25.00 per week or more. In the case of female employees, 20 per cent received less than \$12.00 per week; 67 per cent received less than \$18.00 per week, while 10 per cent of the total number received at least \$25.00 per week.

Results for wholesale trade as for independent retail stores are based on data secured from a sample number of firms rather than the entire field. The figures for wholesale trade are restricted to wholesalers proper; that is, establishments carrying on the full functions of regular wholesale merchants. Other types such as agents and brokers and manufacturers sales branches are not included.

The survey on weekly earnings was further restricted to those firms reporting to the annual Census of Merchandising Establishments and includes those firms which had annual sales of \$100,000 or more in 1930, together with a number of concerns which have commenced operations since that date. The firms included in the survey employed a total of 40,075 persons, 33,345 male and 6,730 female, all of whom were on a full-time basis.
